(1) For applications under seismic action, the diameter of the through-bore must be a maximum of  $d_1 + 1\text{ mm}$ ; alternatively the annular space between the bore and the anchor bar must be filled with grout to the thickness of the plate.  
(2) The maximum torque for M12 with class 4.6 steel is 35 Nm

(1) Both  $d_0$  rated bore diameters can be used.

### Recommended loads on concrete

All recommended loads apply only for single anchoring and for an approximate design, if the following conditions are met:

1.  $c \geq 1,5 \times h_{ef}$ ;  $s \geq 3,0 \times h_{ef}$ ;  $h \geq 2 \times h_{ef}$
2.  $\psi_{sus} = 1.0$ ; percentage of permanent load/total acting load  $\leq \psi_{sus}^0$  (with reference to the application-specific tables below).
3. cleaning: compressed air cleaning.
4. the recommended loads were calculated using the partial safety factors for the strengths stated in the ETA of the product and with a partial safety factor for actions of  $\gamma_f = 1.4$ .
5. the partial safety factor for seismic action is  $\gamma_1 = 1.0$ .

If the above conditions are not met, the loads must be calculated according to EN 1992-4.

The loads given in the following tables refer to a service life of 50 years.

Notes:  
(1) Short-term temperature / Long-term temperature.  
(2) Shear loads refer to the specified temperature ranges.  
(3) The space between the anchoring bar and the bore in the plate must be filled with resin
