

# Geocalce FL Antisismico

Fluid, breathable structural geo-mortar made from pure natural NHL lime and geo-binder – Class M15. Specific for use as a fluid mineral mortar in consolidating injections and as a matrix in combination with GeoSteel galvanised steel fibre thread connectors to create certified connections for structural reinforcement, improvement and seismic adaptation. Certified to improve the safety of buildings.

Geocalce FL Antisismico (anti-seismic) is a special geo-mortar for M15 resistance class consolidation injections according to EN 998-2, in reinforcement and structural alteration of brick, stone, mixed or tuff walls.

## 1. HEALTH AND SAFETY

The first breathable lime-based structural mortars that ensure high permeability to vapour. Used in combination with Kerakoll strengthening systems, they increase the mechanical resistance of the existing walls in order to improve the structural safety of the building.

## 2. LOW ELASTIC MODULUS

Thanks to the use of NHL lime and the geo-binder, the Geocalce range features a low elastic modulus that creates a perfect balance with characteristic strengths typical of masonry structures of all types.

## 3. CULTURE AND TRADITION

The Geocalce range respects and satisfies the needs of applications on buildings subjected to Historical Restoration of Environmental and Architectural Heritage buildings and on traditional buildings.

---

## Natural Ingredients

Pure NHL 3.5 certified natural lime

Mineral geo-binder

Siliceous Washed Natural River Sand  
(0.1-0.5 mm)

Micronized pure white Carrara  
marble (0-0,06 mm)

Pure fine white Carrara marble (0-0,2  
mm)

---

---

## Areas of application

### → Intended use

Geocalce FL Antisismico is ideal for the breathable structural reinforcement of masonry elements, specific for consolidating injections. Geocalce FL Antisismico is suitable to fix artificial thread connector systems made in combination with GeoSteel G600 and G1200 unidirectional, galvanized steel fibre sheets.

Geocalce FL Antisismico is particularly well suited to provide reinforcement of masonry structures in which the all-natural origin of its elements guarantees compliance with the required levels of porosity, hygroscopicity and breathability.

Geocalce FL Antisismico is suitable for natural and breathable consolidation, and for functional recovery of frescoed plaster in Historical Restoration, in which the selection of traditional elements guarantees preservation procedures that respect the existing structures and original materials.

Do not use before grouting, plastering or finishing the surfaces of the masonry elements to be consolidated.

---

## Instructions for use

### → Preparation of substrates

The entire surface of areas to be consolidated with Geocalce FL Antisismico should be grouted or plastered using mortars in the Geocalce range or Biocalce range, while inserting thin tubes or injector nozzles at equal distances (50x50 cm mesh recommended) for subsequent filling with Geocalce FL Antisismico. Containment of the hyperfluid geo-mortar is ensured in this way with no change to the transpiration of the masonry. Before injecting the consolidating and filling geo-mortar into the cracks, weakened parts, cavities or debonding segments, the whole internal structure must be saturated with water, using the same access routes created for the geo-mortar itself.

Inject Geocalce FL Antisismico from the bottom upwards only after you are sure the structure has absorbed all the water injected.

### → Preparation

To prepare Geocalce FL Antisismico, mix one 25-kg bag using clean water, in the amount shown on the package. The mixture is obtained by pouring water into the container and then gradually adding the powder. The mixing process can be performed in a cement mixer, in a bucket (working manually or with a low-rev, mechanical stirring device) or using a continuous mixer until a smooth and lump-free consistency is obtained. a continuous cycle pump equipped with a stator suitable for the maximum grain size of the product (0.1 mm) or an indirect mixing pump may be used.

Use all of prepared mixture; do not reuse it in subsequent mixings. Do not add other components (binders or generic inert materials) to the mix.

# Instructions for use

## → Application

Apply Geocalce FL Antisismico by injection, using mechanical pumps or pressure tanks, or by pouring in from the top. The product should be injected from the bottom upwards in order to ensure all remaining air in the section to be filled is expelled, thereby preventing the formation of air pockets. When Geocalce FL Antisismico comes out of the upper injector, injection is stopped, the injector in use is closed and operation is continued with the higher injector. This must be repeated until reaching the top of the element to be consolidated. On horizontal surfaces, on the other hand, either pour the product or prepare an entry injection into the debonding area and a number of exit holes directly opposite the injection point. In this case

too, the gap has been filled when the geo-mortar begins to overflow from the exit holes.

Geocalce FL Antisismico ensures extended workability and pumping times, and does not become segregated inside the pumps even in the presence of working pressure.

The product may also be pumped from considerable distances and to high points of discharge, thus allowing for setup of the point of operation at ground level on the building site and avoiding manual movement of bags and equipment.

## → Cleaning

Tools can be cleaned using water before the product hardens.

# Special notes

→ In the case of pressure injection, maximum pumping pressure must be monitored and automatically checked to avoid the formation of overpressure or “surges” within the masonry being worked on.

→ The most common control systems are:

- application of a pressure gauge connected with a solenoid valve inside electric pumps
- adjustment of outlet air pressure on the pressure tank compressor (system recommended on account of its simplicity of use and its sensibility of adjustment at low pumping pressures).

# Certificates and marks

CE mark in combination with Geosteel G600 and G1200 for masonry structures

\* Émission dans l'air intérieur Information sur le niveau d'émission de substances volatiles dans l'air intérieur, présentant un risque de toxicité par inhalation, sur une échelle de classe allant de A+ (très faibles émissions) à C (fortes émissions).

# Abstract

Consolidation of cracks and damage on elements in masonry and repair of cavity walls, wattle-type walls and debonding plaster, are achieved by injecting a compact, highly breathable and hygroscopic geo-mortar with excellent water retention and a hyperfluid consistency, with pure NHL 3.5 natural hydraulic lime and geo-binder base (such Geocalce FL Antisismico by Kerakoll Spa). The required characteristics, obtained exclusively through the use of raw materials of all-natural origin, guarantee total resistance to salts. The geo-mortar must also comply with the requirements of EN 998/2-G M15. Reaction to fire class A1. Consolidating injections into loose or damaged material must be carried out at low pressure to avoid the formation of overpressure or “surges” within the structures, which might result in weakening or collapse. Flat surfaces or gaps must be perfectly prepared or grouted to ensure that the injection geo-mortar is contained. Injections will be carried out at a max. of 1.5 bar. Coverage Geocalce FL Antisismico (anti-seismic):  $\approx 1.5 \text{ kg/dm}^3$ .

Technical Data compliant with Kerakoll Quality Standard		
Appearance	powder	
Grading	0 – 0,1 mm	
Shelf life	≈ 12 months from production in the original sealed packaging, protect from humidity	
Pack	25 kg bags	
Mixing water	≈ 7.5 l / 1 x 25 kg bag	
Apparent density of wet mortar	≈ 2000 kg/m <sup>3</sup>	EN 1015-6
Apparent density of dry, hardened mortar	≈ 1500 kg/m <sup>3</sup>	EN 1015-10
Fluidity of mixture (Flow-cone):		EN 445
- 0 min.	52 s	
- 30 min.	50 s	
- 60 min.	48 s	
Ford cup Fluidity	< 60" (with D6 nozzle)	
pH of the mixture	≥ 12	
Segregation	none	
Exudation test	0.1%	EN 445
Temperature range for application	from +5 °C to +35 °C	
Coverage	≈ 1.5 kg/dm <sup>3</sup>	

Values taken at +20 ± 2 °C, 65 ± 5% R.H. and no ventilation. Data may vary depending on specific conditions at the building site.

\* Tests carried out according to JRC method - Joint Research Centre - European Commission, Ispra (Varese, Italy) - to measure the reduction of polluting substances in indoor environments (Indoortron Project). Flow and speed in proportion to a standard construction mortar (1.5 cm).

## Warning

- Abide by any standards and national regulations

→ store the product in places protected against the heat in summer months and against the cold during the winter

→ protect the surfaces from air currents
- if necessary, ask for the safety data sheet

→ for any other issues, contact Kerakoll Technical Customer Service: + 39 0536.811.516
